

## **AMENDMENTS TO THE SPECIFICATION**

The specification at paragraph [0032] has been rewritten as follows:

[0032] A feed supply tube 22 is preferably integrally molded with the fluid control valve body 12. Feed supply tube 22 preferably includes an outer diameter 24[[,]]. The outer diameter 24 [[which]] is preferably in communication with the control passage 20, and the feed supply tube 22 [[and]] preferably includes an inner bore 26 in communication with the supply passage 18 through laterally extending port 28. The feed supply tube 22 is preferably supported in the cavity 16 by at least one or more flying buttress supports 30. Although Fig. 4 depicts four flying buttress supports 30, it should be appreciated that less than, or more than, this number of buttresses may be used in the practice of the present invention. The feed supply tube 22 preferably includes a valve seat receiving area 32.

The specification at paragraph [0033] has been rewritten as follows:

[0033] Referring specifically to Figs. 3, 3A, 6, 7 and 8, a valve seat member 34 is preferably made out of plastic and is press fit over the valve seat receiving area 32. By this arrangement, fluid passage is allowed axially between the buttresses 30, while side loads on the valve seat member 34 are directed to the thicker base of the ribs where they are better absorbed. An alignment shelf 36 is preferably provided on the fluid control valve body 12 for providing proper depth of alignment of the valve seat member 34. A ball valve 38 is preferably held between the valve seat 40 and the valve seat receiving area 32. The valve seat member 34 preferably provides a passageway 42 to the fluid control passage 20. The ball valve 38 is preferably operable to selectively cut off supply of flow from the pressure supply channel 18 to the pressure

control passage 20. The first step of the path of fluid flow is that fluid enters into the lateral extending support 28 from outside of the solenoid control valve 10. The fluid then flows through the fluid supply passage 18 and into inner bore 26. Once the fluid enters the inner bore 26, the fluid will flow through ball valve 38, through passageway 42, and into the control passage 20. The solenoid control valve 10 is configured such that the lateral extending support 28 and the control passage 20 only communicate fluid through ball valve 38.
